Scancell (LSE:SCLP; www.scancell.co.uk) is a clinical stage company leveraging two proprietary platforms, Immunobody® and Moditope®, to develop targeted off-the-shelf, patient-accessible active immunotherapies designed to generate safe, potent and long-lasting tumour-specific immunity for a cancer-free future. The lead product, iSCIB1+, an Immunobody® active immunotherapy that has demonstrated monotherapy activity in adjuvant melanoma. When combined with checkpoint therapies it showed additional clinical benefit over the checkpoints (CPI) alone in the ongoing Phase 2 SCOPE trial in advanced melanoma. The precise patient population that iSCIB1+, in combination with CPIs bring benefit has been identified – enabling a precision-biomarker led registrational development. The lead Moditope® peptide active immunotherapy, Modi-1, is being investigated in a Phase 2 study in a broad range of solid tumours and also has shown encouraging interim clinical data. Scancell's wholly-owned subsidiary, Glymab Therapeutics Ltd., is developing an exciting early-stage pipeline of high affinity GlyMab® antibodies targeting tumour specific glycans, two of which already have been licensed and are being developed by Genmab A/S, an international biotechnology company and global leader in the antibody therapeutics space.
